CPU Run-time is 1.98 seconds and it is a graphical plug-in.. Cracked from (2013/03/29) BUILT042 by cracker_c++. Please be aware that this version will NOT work. [B42], [B43], [B44], [B45]. Consequently, while technical standardization of existing testing protocols and the adoption of additional standardization protocols is desirable, researchers must first understand the clinical context in which CATs are to be used to inform subsequent attempts at CAT development and validation. In this section, we discuss two such contexts: assessing executive function among children with ASD, and testing the use of war-related trauma among relatives of combat veterans. Implications for Children with ASD ----- Since executive function is a well-established predictor of academic and occupational achievement [B46], studies which demonstrate that CATs are valid for children with ASD could have significant implications for clinical practice. For example, the CAT designed by the Bruininks-Oseretsky Test of Motor Proficiency [B18] has been recommended for evaluating children with ASD by the U.S. Administration of Children's Services [B20] and by the National Society for Autistic Children [B47]. Moreover, the Wisconsin Card Sorting Test [B48] has been recommended as a tool to assess problem solving skills among children with ASD [B47]. As described by Siegel and Soloman [B49], increasing the validity and efficiency of assessment is a primary goal of any test. While a CAT is intended to be more efficient than a full-length test, it is not designed to eliminate all potential confounding factors. Additionally, a CAT is expected to demonstrate criterion validity by correlating well with a full-length test. Thus, further research on the validity of a CAT for children with ASD is needed. In the present study, the validity of the CAT War-Related Trauma among Children was supported by relations with the ASRS and the SSQ-P. While this study indicates that the CAT War-Related Trauma among Children may have some practical value for the diagnosis of ASD, the CAT was not designed to be used as an assessment for children with ASD, but rather is designed to be used for screening for PTSD among relatives of combat veterans. Implications for relatives f678ea9f9e
